FRV *Alba na Mara*

Survey 1511A

PROGRAMME

19 October – 4 November 2011

Ports

Loading: Fraserburgh, 14 October 2011

Port Call: Stornoway / Ullapool / Mallaig, 26 October

Unloading: Ullapool, 4 November 2011

In setting the cruise programme and specific objectives, etc the Scientist-in-Charge needs to be aware of the restrictions on working hours and the need to build in adequate rest days and rest breaks as set out in Marine Scotland's Working Time Policy (Lab Notice 34/03). In addition, the Scientist-in-Charge must formally review the risk assessments for the cruise with staff on-board before work is commenced.

In the interest of efficient data management it is now mandatory to return the Cruise Report, to I Gibb and the Cruise Summary Report (old ROSCOP form) to M Geldart, within four weeks of a cruise ending. In the case of the Cruise Summary Report a nil return is required, if appropriate.

Personnel

M Robertson	(SIC)
C Hall	
J Mair	
M Carruthers	SNH
N Hirst	Heriot Watt University

Estimated days by project: 17 days – SP02q (10797)

Sampling Gear

Day grab, grab table and sieving stand
1mm sieves, 5mm sieves
Drop frame and TV sledge
UW TV cameras and digital still cameras
600m umbilical
MSS Triple Chamber fish traps

Objectives

The survey will encompass a region from the North Minch, including the East Shiant Bank and Shiant Islands and south to the Little Minch (see Figures 1 and 2). Contingency sampling stations along the east coast of the Outer Hebrides and on the west coast of the Scottish

mainland have also been included in the sampling programme. These will only be sampled if the weather conditions prevent work in the core sampling area.

This survey will gather biological data to help inform the importance of large scale features (LSFs) within Scottish waters. These LSFs represent areas of functional significance to the overall health and biological diversity of Scottish seas and are intended to compliment the MPA search feature habitats which, whilst not necessarily containing these MPA features, have a benefit by supporting wider ecosystem function. Using a combination of underwater video, grabs and fish traps, the survey will seek to gather information on the benthos and mobile fish species that utilise the LSFs.

General

Loading of the MSS sourced scientific gear will take place on the 13 and 14 October in Fraserburgh, other items supplied by SNH will be delivered to the vessel on or before the 19 October. Alba na Mara will then sail on the morning of 19 October and, once safety drills and vessel familiarisation tours have taken place, Alba na Mara will make passage to the first sampling positions in the Minch. A daily operational sampling plan will be formulated and agreed by the SIC, the Captain and the SNH representative. A half-landing will be take place around the 26 October, the port to be visited will be decided during the first half of the cruise. J Mair may have to leave the vessel at some point towards the end of the survey, again port and date to be decided nearer the time. Alba will be offloaded in Ullapool on 4 November when all scientific personnel, samples and sampling gear will return to Aberdeen

Procedures

Video and Stills (301 Stations, see Table 1)

Underwater video tows (5-20 minutes duration) will be attempted throughout the survey area. The video will be carried out either using a drop frame or a TV sledge. Despite a sledge being the preferred technique it is anticipated that much of the ground will not be conducive to this method, with large areas containing a mixture of stones, boulders and rocky outcrops (please refer to recent MSS (2009 and 2010) data and admiralty charts, principally on the tops and flanks of the banks and mounds. In situ video analysis will enable crude discrimination of biotopes and identification of common species, whilst allowing a critical assessment on the viability of other proposed methods (e.g. grabs, multigrabs etc.)

The video stations have been grouped into 4 categories: high priority (147), low priority (63), contingency (75) and contingency half-day (16). All high priority and almost all low priority stations are within the core boundary (Figure 1). In the event of bad weather a number of contingency stations are located along the east coast of the Outer Hebrides and the west coast of mainland Scotland. The contingency stations have a greater overlap with historic data and will contribute to regional data gaps and previous MPA related survey work (e.g. determining the extent of maerl distribution to the north and south of Loch Gairloch). In the event that Broad Bay offers a suitable shelter from poor weather a sub-group of contingency points have been designated within the bay.

Grabs (49 Stations, see Table 2)

These grabs, for the collection of infaunal animals, will be allocated the same priority categories as the video tows above. All of these stations will have a video component, however, it is likely

that some of these will not grab due to the nature of substratum on the site. A sediment sample will be taken from each successful grab and stored for PSA analysis.

Multigrabs (6 Stations, see Table 3)

These are given the priorities ‘high’ and ‘contingency’ only. A series of 5 grabs will be taken at each point. The sediment will be worked through a coarse sieve and any *Arctica*, *Glossus* or sandeels recorded (enumerated and length/width measured), and returned to the sea.

Grabs Only (9 Stations, see Table 4)

Video data from a number of locations will be complemented and ground-truthed by a single infaunal grab sample.

Fish Traps (21 Stations, see Table 5)

Classified as high and low priority, traps will be deployed in pairs at each station and left for ~24 hours. Upon retrieval all species of fish will be enumerated, weighed, measured and identified. Gut contents will be examined from a small percentage of these fish and recorded where possible. Length, weight data and otoliths will be collected from commercial species.
