

**FRV Walther Herwig III  
Cruise 380  
01.12. – 19.12.2014**

**Studies on Fish Diseases and Biological Effects of Contaminants  
in the North Sea and Baltic Sea**

**NATO project MODUM**

Scientist in Charge: Dr. Thomas Lang

**Summary**

As part of the fish health monitoring programme of the Thünen Institute of Fisheries Ecology (FI), studies were carried out in five Baltic Sea and three North Sea areas. In addition to the onboard examination of dab (*Limanda limanda*), flounder (*Platichthys flesus*) and cod (*Gadus morhua*) for externally visible diseases and parasites, a large range of fish samples were taken for a subsequent analysis of contaminants (incl. radioactive substances) and their biological effects. As part of the NATO-funded MODUM project (2013-2016), extensive studies were carried out on the health status of cod in dumping areas for chemical munitions and reference areas. Hydrographical measurements were carried out (water temperature, salinity, oxygen content, turbidity). The planned use of an autonomous underwater vehicle (AUV IVER2) and visual observations on drifting marine litter in the North Sea had to be cancelled due to adverse weather conditions. The following preliminary findings were noted:

**Dab:** Slightly elevated prevalence of lymphocystis, hyperpigmentation and macroscopic liver neoplasms (tumours), epidermal hyperplasia/papilloma and macroscopic liver neoplasms in the North Sea; prevalence of lymphocystis in the Baltic Sea (Kiel Bight) higher than at North Sea sites in the German EEZ.

**Baltic cod:** Low prevalence of acute/healing skin ulcerations and skeletal deformities; nematodes in the body cavity in all Baltic Sea areas, especially in the eastern sampling areas B13 (Bornholm Basin) and B09 (outside Gdansk Bay); comparatively high prevalences of the gill parasite *Lernaeocera branchialis* and the skin parasite *Cryptocotyle lingua* in Kiel Bight; generally high prevalence of the gill parasite *Loma branchialis*.

**Participants:**

Name	Function	Institution
Dr. Thomas Lang	Scientist in Charge	TI FI Cuxhaven
Jennifer Ipse	Technician	TI FI Cuxhaven
Marc-Oliver Aust	Scientist	TI FI Hamburg
Wolfgang Lindemann	Technician	TI FI Hamburg
Horst Bahl	Scientist	TI FI Hamburg
Finn Werner	Technician	TI FI Hamburg
Dr. Jacek Bełdowski	Guest Scientist	IOPAS, Poland
Jan Majcher	Guest Scientist	IOPAS, Poland
Michael Klein	Guest Scientist	Switzerland
Gabriele Dederer	Guest Scientist	Datadiving, Hamburg
Christoph Rummel	Student	University Rostock
Liliana Lehmann	Student	University Berlin
Luisa Berghoff	Volunteer	University Kiel
Fabian Deister	Volunteer	University Oldenburg

## **Objectives of the Cruise**

1. Studies on the occurrence of fish diseases and parasites in the North Sea and Baltic Sea;
2. Studies on biological effects of contaminants;
3. Studies in the MODUM project (e.g. use of the autonomous underwater vehicle IVER2);
4. Sampling of fish for chemical analysis of contaminants;
5. Hydrographical measurements (salinity, temperature, oxygen, turbidity);
6. Visual detection of drifting marine litter in the North Sea.

## **Dates of the Cruise**

FRV Walther Herwig III left Bremerhaven in the morning of 01.12. The scientific crew already had boarded in the evening of 30.11. After the passage of Kiel Channel on 02.12., the vessel sailed to the first sampling area in the Baltic Sea, where work started in the afternoon of 04.12. in area B09 outside Gdansk Bay. In the morning of 05.12., WHIII arrived in Gdynia, where two scientists (Dr. Jacek Beldowski, Jan Majcher) from the Institute of Oceanology, Polish Academy of Sciences, were taken on board. In the afternoon work was resumed in area B09. During the following days, sampling was conducted in areas BHB, B13 (7./8.12.), B11 and B01 (10./11.12.). In the afternoon of 13.12., Walther Herwig III arrived in Kiel, where an exchange of scientific staff members took place.

On 14.12., WH III again passed Kiel Channel. In the period 15.-17.12., sampling was continued in three North Sea areas (GB1, N01, GB3). Due to bad weather conditions, work had to be finished two days earlier than scheduled. In the evening of 18.12., WHIII arrived in Bremerhaven, where the cruise ended in the morning of 19.12.

The location of the sampling areas and the cruise dates are shown in Fig. 1 and 2 and Tab. 1. In 8 sampling areas (Fig. 1), a total of 32 fishing hauls was performed (towing time 30–60 min. each) (geographical coordinates in Tab. 1, catch composition in Tab. 2). In the Baltic Sea, a 140 ft bottom trawl and a pelagic PSN 205 net were used, in the North Sea a GOV net, all with standard configuration. Hydrographical measurements were made at all fishery stations (geographical coordinates in Tab. 1a, results in Tab. 3).

## **Preliminary Results**

### **1 Dab (*Limanda limanda*)**

In total, 2,455 dab from one Baltic Sea and three North Sea areas were examined for the occurrence of externally visible diseases and parasites (Tab. 4) and 316 dab for the occurrence of liver anomalies (Tab. 5).

The prevalence of some diseases in the North Sea has increased compared to the previous summer cruise (WH cruise 377, 28.08.-17.09.2014). The prevalence of lymphocystis was in range of 3.4 % - 10.5 %, with the lowest value in the inner German Bight (area GB1) und the highest values in area GB3. The prevalence of epidermal hyperplasia/papilloma did not differ between areas (3.2 % - 3.7 %). The prevalence of hyperpigmentation in area N01 has increased compared to previous cruises (43.0 %), the lowest value was again found in area GB1 in the inner German Bight (28.7 %). The strongest regional differences were noted for the parasite *Stephanostomum baccatum* (juvenile digenetic trematode under the skin), the prevalence of which ranged from 4.5 % (inner German Bight, area GB1) to 32.3 % (area GB3). Acute/healing skin ulcerations were rare, the prevalence ranged from 0.4 % (area GB3) to 1.4 % (area GB1).

For the majority of diseases, there was a prevalence gradient – as during the previous summer cruise (WH cruise 367, 28.08.-12.09.2013) - in the German EEZ in north-westerly direction, with increasing values from the inner German Bight (area GB1) to the Dogger Bank (area GB4) (see Fig. 3. and Tab. 4). When interpreting this finding, it has to be taken into account that the mean total length of the dab examined increased in north-westerly direction, too, possibly affecting the prevalence, but not exclusively responsible for the gradient recorded.

The prevalence of liver nodules >2 mm (= tumours and pre-stages) was slightly elevated in North Sea dab compared to the summer cruise 2014. For dab of the size range 20-24 cm total length, it was in

the range of 1.9 % (German Bight, area GB1) to 7.7 % (area N01), for dab of the size group  $\geq 25$  cm the prevalence ranged from 4.5 % (area N01) to 13.3 % (inner German Bight, area GB1).

Baltic Sea dab from Kiel Bight (area B01) displayed differences in disease prevalence to the North Sea dab especially for hyperpigmentation and the parasites *Stephanostomum baccatum*, *Acanthochondria cornuta* (copepode on the gills) and *Lepeophtheirus pectoralis* (copepode on the skin and under the pectoral fins): These diseases/parasites are extremely rare in the Baltic Sea. There was no difference in prevalence of epidermal hyperplasia/papilloma, acute/healing skin ulcerations, fin rot, X-cell gill disease and skeletal deformities between the Baltic Sea and North Sea. However, the prevalence of lymphocystis in Kiel Bight (area B01; 11.4 %) was higher compared to the North Sea sampling areas. The prevalence of liver nodules  $>2$  mm was only slightly lower (20-24 cm: 2.0 %;  $\geq 25$  cm: 3.8 %) than in the North Sea.

## 2 Flounder (*Platichthys flesus*)

468 flounder from four Baltic Sea areas were examined for the occurrence of externally visible diseases and parasites (Tab. 6). The prevalence of the most frequent disease lymphocystis was in the range of 17.0 % (Arkona Sea, area B11) to 37.6 % (outside Gdansk Bay, area B09). The prevalence of acute/healing skin ulcerations were generally low; only in area B09 an increase value of 9.9 % was recorded. For *Lepeophtheirus pectoralis*, the marked regional pattern previously known was confirmed: During this cruise, the parasite occurred only in Kiel Bight (area B01), where a prevalence of 74.3 % was recorded.

## 3 Cod (*Gadus morhua*)

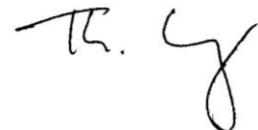

In total, 2,160 cod from five Baltic Sea areas were examined for externally visible diseases and parasites, and 488 specimens for nematodes in the body cavity (Tab. 7). The disease prevalence was low in general; for acute/healing skin ulcerations it ranged from 1.1 % (Arkona Sea, area B11) to 3.7 % (outside Gdansk Bay, area B09). Skeletal deformities were rare, too, the maximum values was 2.2 % (area B09). Larval nematodes in the body cavity were recorded in cod from all sampling areas, with the highest prevalence in the eastern areas B13 (Bornholm Basin) (58.3 %) and B09 (outside Gdansk Bay) (57.3 %). In Kiel Bight, the parasites *Lernaeocera branchialis* (copepode in the gills) and *Cryptocotyle lingua* (black trematode cysts in the skin) were comparatively prevalent with prevalences of 7.0 % and 74.6 %, resp. The gill parasite *Loma branchialis* was very prevalent in all areas (69.1 % - 92.5 %).

## 4 Miscellaneous

The mean catch data of the most frequent fish species are provided in Tab. 2; Tab. 3 gives results of the hydrographical measurements.

## Acknowledgements

Thanks are due to Captain Vandrei and his crew and to the scientific staff for constructive and hard work and a very good atmosphere on board.

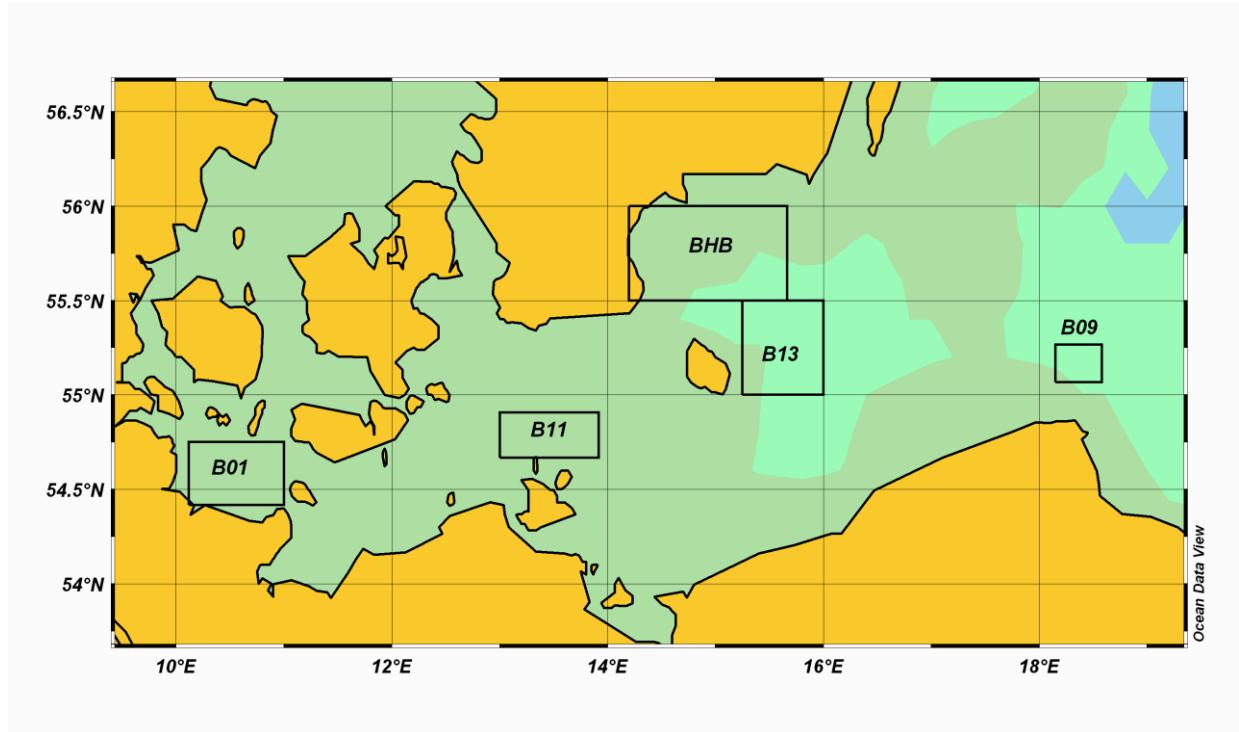

Dr. Thomas Lang

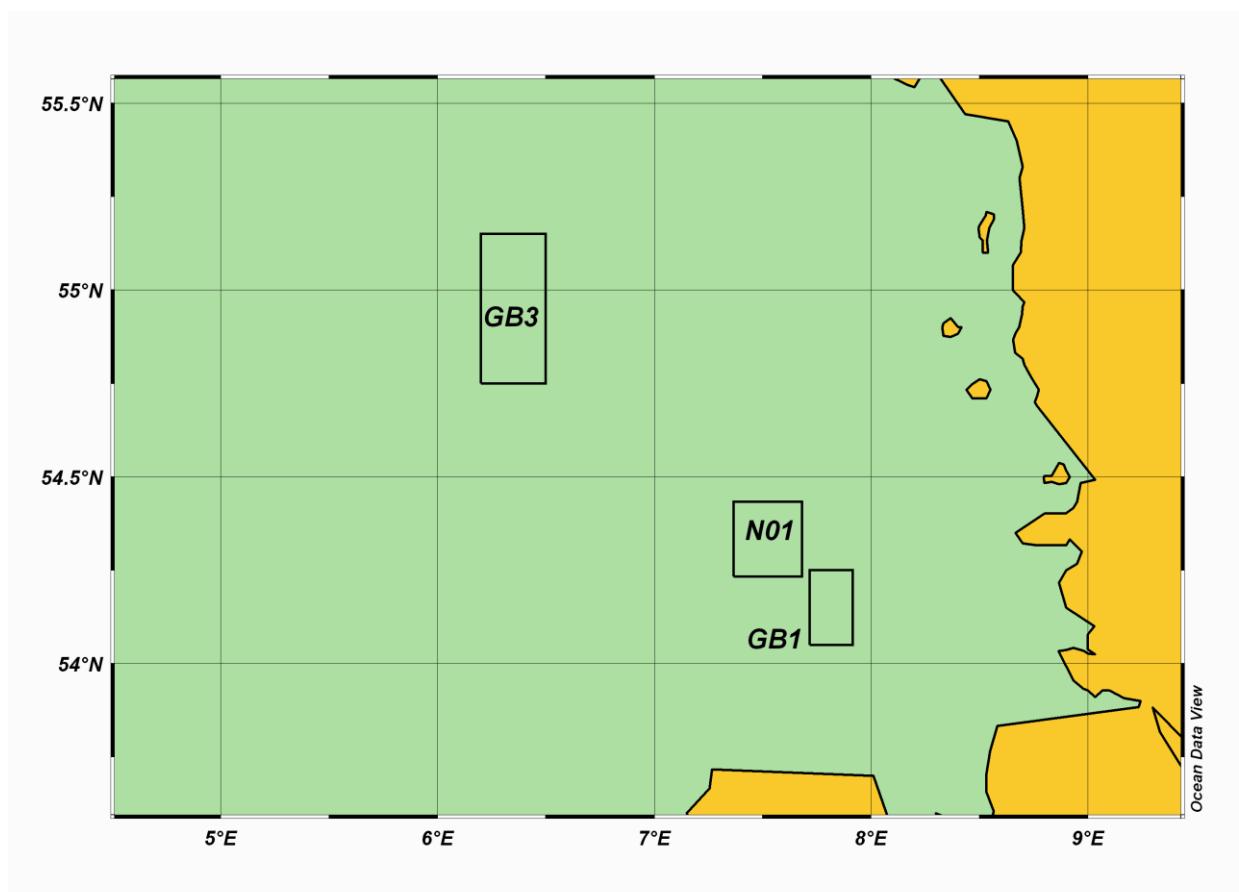

(Scientist in Charge)
